PRACTICAL USE OF FIRE EXTINGUISHER

APM FACTORY

Amidst the hustle and bustle of daily operations at APM factory, ensuring workplace safety remains a paramount concern in GREL. Recognizing the critical importance of fire safety, a comprehensive training session was organized by the APM HSE department from 26th to 28th February, 2024 at APM factory to empower workers with the knowledge and skills needed to effectively respond to fire emergencies. Participants engaged fervently as they absorbed valuable insights of the overview of fire safety fundamentals, the potential risks associated with fire incidents, three fuels for fire: oxygen, heat, and combustible material, and how they interact to either ignite or quench fire. There was also an education on the classes of fire and the kinds of fire extinguishers that can be used to quench each class of fire.

This internal training program engaged participants fervently as they gained valuable insights of the overview of fire safety fundamentals, the potential risks associated with fire incidents, three fuels for fire: oxygen, heat, and combustible material, and how they interact to either ignite or quench fire. There was also an education on the classes of fire and the kinds of fire extinguishers that can be used to quench each class of fire.

Participants were given the opportunity to put into practice what has been taught, under the watchful guidance of instructors, they grasped extinguishers firmly, and tactfully tackled some simulated fire scenarios.

The training later progressed into essential evacuation procedures and fire safety protocols. Participants learned the importance of clear communication, designated assembly points, and the significance of maintaining unobstructed evacuation routes.
